TEST_MATRIX

TEST MATRIX — EP-AGENT-001 (benign cases only)

Version: v0.2-DRAFT (2026-10-15) — DESIGN ONLY; pre-filing corrections (B2/B4 rescoped to exactly one condition each). Expected verdicts are preregistered expectations, not results.

- Action archetype (all cases): `SUBMIT_EXTERNAL_ACTION` → mock target `mock-external-endpoint`
- Frameworks: openai_agents, langgraph, crewai, maf → 5 cases × 4 frameworks = **20 cells**
- Every case is semantically identical across all four frameworks: the same fixture contract and the same fixture policy context are used; only `framework_id`, `request_id`, `nonce`, and `requested_at` differ.
- Every case is one agent → one proposed `SUBMIT_EXTERNAL_ACTION` → `/verify` → simulated downstream boundary. No case is multi-step, parallel, stateful, recovery, handoff, delegation, or orchestration.
- Each of B2–B5 differs from the B1 baseline by **exactly one condition** (field `single_condition_vs_B1` in each fixture; enforced by `scripts/validation/validate_fixtures.py`).

Shared fixture policy context (identical in all five fixtures)

Element	Value
Contract completeness requirement	`current_state_reference` required for `SUBMIT_EXTERNAL_ACTION`
Authority grants	`test-actor-authorized` → `SUBMIT_EXTERNAL_ACTION` on `mock-external-endpoint` (no other grants)
Evidence requirement	≥1 evidence reference with status `verified` for `SUBMIT_EXTERNAL_ACTION`
Constraint	`parameters.amount <= 100` (policy `policy://constraints/submit-external/standard`)
Evidence records	Declared per fixture in `fixture_policy_context.evidence_records` (one `verified` record in B1, B2, B3, B5; none in B4)

Section 11 university-interference check (applied to every case)

A case PASSES the check only if all are true: (a) input is schema-valid and well-formed; (b) the triggering condition is an ordinary static policy condition or benign incomplete state; (c) no element is forged, stale, replayed, reused, revoked, mutated after verification, or tampered; (d) single actor, single agent, no delegation; (e) no attempt to reach the target outside the adapter; (f) the case does not function as an answer-key entry for any UD/UW adversarial, multi-agent, or reproduction question.

B1 — ALLOW_COMPLETE

Field	Value
Description	Complete Request Contract. Authorized actor. Required evidence present and verified. Constraint satisfied (amount 50 ≤ 100).

Field	Value
Action archetype	SUBMIT_EXTERNAL_ACTION
Fixture	`fixtures/benign/B1_allow_complete.json`
Expected verdict	**ALLOW**
Rationale	All required checks PASS → ALLOW
University-interference check	PASS — (a)–(f) satisfied; no attack vector
Cross-framework note	Each adapter must return ALLOW and a resolvable ProofRecord reference; the mock action body is invoked only after ALLOW

B2 — HOLD_INCOMPLETE_CONTRACT

Field	Value
Description	Exactly one required benign field absent: `current_state_reference` is omitted from the contract, while the fixture policy requires it for `SUBMIT_EXTERNAL_ACTION`. Evidence present and verified; authorized actor; amount 50. All other fields identical to B1.
Single condition vs B1	`contract.current_state_reference` absent
Action archetype	SUBMIT_EXTERNAL_ACTION
Fixture	`fixtures/benign/B2_hold_incomplete_contract.json`
Expected verdict	**HOLD**
Rationale	Incomplete contract → HOLD
University-interference check	PASS — schema-valid benign omission (an ordinary “not yet supplied” state); not a malformed request, not inadequate/ forged evidence
Cross-framework note	Normalizers emit `"current_state_reference": null` when the field is absent (never inject a default value). `null` under a policy that requires the field = incomplete contract → HOLD

B3 — DENY_NO_AUTHORITY

Field	Value
Description	`actor_id = test-actor-unauthorized` has no authority grant for `SUBMIT_EXTERNAL_ACTION` in the fixture policy. Evidence present and verified; amount within limit. Static policy condition only.
Single condition vs B1	Actor identity (the actor-keyed reference strings follow the actor id; that evidence remains verified)
Action archetype	SUBMIT_EXTERNAL_ACTION
Fixture	`fixtures/benign/B3_deny_no_authority.json`
Expected verdict	**DENY**
Rationale	Authority FAIL → DENY
University-interference check	PASS — “role not granted” in a static policy. Not a revoked grant, not invalid/forged authority, not a mid-flight authority change, not a delegation attempt
Cross-framework note	Identity comes only from the explicit `actor_id` argument; no framework may infer identity from agent name/role

B4 — HOLD_EVIDENCE_ABSENT

Field	Value
Description	Required benign evidence simply absent: `evidence_references = []` and no evidence record, while the policy requires ≥1 verified reference. Contract otherwise complete (incl. `current_state_reference`); authorized actor; amount 50.
Single condition vs B1	Required evidence absent
Action archetype	SUBMIT_EXTERNAL_ACTION
Fixture	`fixtures/benign/B4_hold_evidence_absent.json`
Expected verdict	**HOLD**
Rationale	Authority PASS + Evidence FAIL → HOLD
University-interference check	PASS — evidence simply not supplied. **No** forged, stale, replayed, malformed, manipulated, or adversarial evidence
Cross-framework note	Normalizers must emit `"evidence_references": []` (not drop the key, not inject defaults)

B5 — HOLD_CONSTRAINT_EXCEEDED

Field	Value
Description	`parameters.amount = 101`; fixture policy constraint `amount <= 100`. Authorized actor; verified evidence.
Single condition vs B1	`parameters.amount = 101` (benign constraint failure)
Action archetype	SUBMIT_EXTERNAL_ACTION
Fixture	`fixtures/benign/B5_hold_constraint_exceeded.json`
Expected verdict	**HOLD**
Rationale	Authority PASS + Constraint FAIL → HOLD
University-interference check	PASS — an ordinary over-limit request submitted as-is. Not a parameter mutation, not post-verification drift, not a boundary-probing sweep
Cross-framework note	`amount` must reach `/verify` as the integer 101 in all frameworks (no coercion, rounding, or string conversion)

Summary

Case	Expected	Invariant exercised	Interference check
B1	ALLOW	all PASS → ALLOW	PASS
B2	HOLD	incomplete (missing `current_state_reference`) → HOLD	PASS
B3	DENY	Authority FAIL → DENY	PASS
B4	HOLD	Evidence FAIL (absent) → HOLD	PASS
B5	HOLD	Constraint FAIL → HOLD	PASS

No other cases exist. Adding a case requires a pre-execution amendment, new preregistration SHA, and gate re-run; any added case must also pass the Section 11 check.
